DRAFT

1. Executive Summary

This 2025 update of the Common Operational Dataset on Population Statistics (COD-PS) in Sudan draws on the best available population and demographic data (spanning 20 key data sources), as of July 1, 2025, and provides a snapshot of the projected population by sex and 5-year age groups at the ADM-2 level. It provides reference population estimates to guide humanitarian needs assessment and operational humanitarian response plans.

This 2025 COD-PS update projects the population of Sudan to be approximately 47.55 million persons, as of July 2025, comprising approximately 23.78 million females and 23.77 million males. In addition to the mortality and fertility effects of war and fragility, the largest component of population change in recent years has been conflict-related mobility – both across international borders and within the administrative boundaries of Sudan. This COD-PS update highlights the recent notable changes in population size and age/sex structure across states

and localities across Sudan and integrates data and evidence on population changes due to mortality and fertility inside of Sudan and mobility within and out of Sudan up to July, 2025.

The 2025 COD-PS update was cross-validated with comparable population estimates and projections at the national level (ADM-0 geographic area), at the state level (i.e. across 18 ADM-1 geographic areas of Sudan), and at the locality level (i.e. across the 188 ADM-2 geographic areas of Sudan). Cross-validation sources included the 2024 revision of the UN's World Population Prospects (for the ADM-0 geographic area), post-censal projections by the Central Bureau of Statistics, Sudan and population estimates by the Integrated Food Security Phase Classification (IPC) (for ADM-0, ADM-1 and ADM-2 geographical areas). Our cross-validation analysis notes differences between the 2025 COD-PS and estimates and projections by the CBS and IPC particularly for Khartoum and West Darfur – which reflects the substantial population mobility for those states but also notes the measurement uncertainty associated with population projections for localities within those states.

2. Background

Since the outbreak of conflict in Sudan in April 2023 between the Sudan Armed Forces (SAF) and Rapid Support Forces (RSF), more than 12 million people have fled their homes, including approximately 7.7 million internally displaced persons (IDPs). The crisis has extended to neighboring countries, including Chad, Egypt, South Sudan, that host over 4 million asylum seekers and refugees who have crossed international borders in search of safety and access to basic livelihood essentials. Such mobility dynamics, in addition to recent changes in the fertility and mortality dynamics in Sudan, make the updating of baseline subnational population projections (disaggregated by age and sex) challenging. Yet, updated population projections (by age and sex, and at the lowest administrative level possible) are crucial for short-term humanitarian operational response as well as long-term social, economic and community reconstruction.

3. Summary

The 2025 Common Operational Dataset on Population Statistics (COD-PS)[1] update for Sudan uses the 2008 population census data as a baseline population and projects the population forward to a reference date of July 2025.

[1] The Common Operational Dataset on Population Statistics (COD-PS) is a set of up-to-date (i.e. reference date within the last year) subnational population projections, disaggregated by sex and age (standard 5-year demographic age groups) to the lowest geographic administrative level possible. The COD-PS is constructed according to "best available humanitarian data" standards and designed to support short-term humanitarian decision-making. The COD-PS is one of 3 mandatory common operational datasets, alongside common operational datasets on administrative boundaries and humanitarian caseloads, that are required in all operational humanitarian response countries by the United Nations. Ensuring the availability, quality and usability of the COD-PS is an institutional responsibility of the United Nations Population Fund (UNFPA) within the United Nations humanitarian system.

DRAFT

The 2025 COD-PS uses empirical mortality, fertility, and migration patterns derived from the census and household surveys. It also incorporates operational humanitarian data on crisis-related mobility and forced displacement to account for crisis-related mobility between 2008 and April 2023, and after the start of the current crisis that began in April 2023.The 2025 COD-PS update for Sudan comprises ADM- 2 level estimates of population size by sex and standard 5-year demographic age groups[2], and is provided to support operational humanitarian response and preparedness efforts.

4. Data Sources

As an initial step to inform the development of the 2025 Sudan COD-PS update, UNFPA carried out a data asset mapping exercise to identify the available data related to baseline population and recent population change. These data sources were assessed based on their availability and usability for the 2025 COD-PS update.

Available data for each component of population change is summarized in the table below:

Table 1: Summary of Available Data Sources

Type of Data	Data Source	Geographical disaggregation	Age/sex disaggregation
Administrative Boundaries	Common Operational Dataset on Administrative Boundaries, provided by UN OCHA	ADM-2	NA
	(Historical) United States Census Bureau (UCSB) administrative boundary datasets with reference dates of: a. 2011 (aligned with retabulated census dataset) b. 2020 (aligned with projected estimates developed for the Integrated Food Security Phase Classification (IPC) 2020 estimates)	ADM-2	NA
	(Historical) Integrated Public Use Microdata Series (IPUMS) 2008	ADM-2	NA

[2] The official administrative regions in Sudan are as follows: ADM-0 is the country level (defined as the official international borders of Sudan, as recognized by the United Nations); ADM-1 consists of 18 states; ADM-2 consists of 188 localities. These are reflected in the Common Operational Dataset on Administrative Boundaries, as updated by OCHA. The COD-PS does not include a population projection for the area of Abyei, which is under the Permanent Court of Arbitration. For details, please see https://data.humdata.org/dataset/cod-ab-sdn.

DRAFT

	Census administrative boundaries		
Baseline Population	Central Bureau of Statistics 2008 Census Tabulations and Priority Results	ADM-2 (2008 boundaries)	Available by ADM-1 area (2008 boundaries)
	USCB 2021 Subnational Population and Housing Table, including 2008 census counts (from Priority Results publication) retabulated to 2011 boundaries	ADM-3	Only disaggregation by sex available for retabulated counts
	IPUMS 2008 census microdata 16.6% sample	ADM-2 (2008 boundaries)	Available by ADM-2 area (2008 boundaries)
	Central Bureau of Statistics 2021-2025 postcensal projections, with the 2008 census as a baseline. These projections were incorporated directly into the 2023 COD-PS for Sudan.	ADM-2 (177 localities)	Yes, 5-year age groups
	IPC projected population counts, based on CBS projections and humanitarian operational datasets, updated periodically from July 2019 to October 2024	ADM-2	Not available
Mortality and Fertility	CBS census thematic reports on Mortality and Fertility, including life expectancy and total fertility rate estimates based on the 2008 and 1993 censuses	ADM-1 (2008 boundaries)	Life expectancy at birth estimates by sex at ADM-0 level
	UNICEF Multi-Indicator Cluster Survey, 2014 and 2010, with information on fertility and child mortality	ADM-1	Yes
	Armed Conflict Location and Event Data (ACLED) project data on conflict-related fatalities	ADM-3	Not available
Migration/ Mobility	IPUMS 2008 census microdata 16.6% sample, including question on ADM-1 place of residence one year prior to the census reference date	ADM-2 (2008 boundaries)	Available by ADM-2 area (2008 boundaries)
	UNHCR-collated counts of	ADM-0	Yes, where

DRAFT

	refugees and asylum seekers with Sudan as a country of origin or asylum, available annually or mid-year from 1963 to end-2024		available
	UNHCR-UNICEF model-based age-sex disaggregated estimates for refugees and others in need of international protection, available for end-2022 and end-2023. Methodology described in Beise et al. (2023). Model-based estimates impute missing values for records lacking information on age and sex. As per Global Trends 2022, for individuals with Sudan as a country of origin, 93% of refugee records and 82% of asylum-seeker records had information on age and sex; 97% of refugee records and 83% of asylum-seeker records had information on sex alone. For individuals with Sudan as a country of asylum, 100% of refugee and asylum-seeker records had information on age and sex.	ADM-0	Yes, broad age groups
	UNHCR operational dataset on total new arrivals of refugees and asylum seekers with Sudan as a country of origin, as well as refugee returnees (refugees and asylum seekers with Sudan as a country of asylum, now returning to their countries of origin)	ADM-0	Yes, broad age groups
	UNHCR operational dataset on self-relocated refugees with Sudan as a country of asylum	ADM-1	Yes, broad age groups
	UNHCR-consolidated country registration data on ADM-1 and ADM-2 places of origin for refugees and asylum seekers with Sudan as a country of origin. This dataset covers refugees and asylum seekers arriving in 5	ADM-2	Not available

DRAFT

	countries included in the Refugee Response Plan (Central African Republic, Chad, Egypt, Ethiopia, and South Sudan), with reference dates of March 2024 and July 2025. Given challenges in implementing more detailed registration approaches, this dataset does not fully cover the refugee and asylum seeker population in these countries. Insights derived from this data were previously published in an April 2024 UNHCR report.		
	IOM Displacement Tracking Matrix (DTM) datasets and reports Key reference: Mobility Update 19 (Reference: 25 June, 2025), reflecting IDPs displaced from 2003 onwards (both prior to and after April 2023)	Site level (place of origin information provided at the ADM-2 level)	Yes, broad age groups
	IOM Sudanese Migrant Survey Primary Findings Report, detailing key insights from a household survey carried out in July 2022 on migration patterns and intentions across all ADM-1 areas, covering nearly 17,000 households.	ADM-1 (in study report)	Not available (in study report)
	United Nations World Population Prospects 2024 revision international net migration totals	ADM-0	Not available

5. Summary of Technical Approach

The 2025 COD-PS update uses a cohort-component population projection approach, which involves estimating the key components of demographic change – mortality, fertility, and mobility, since the date of the last census) to July 1, 2025 at the ADM-1 level. These ADM-1 population projections are then disaggregated to ADM-2 using Iterative Proportional Fitting (Norman, 1999; Hunsinger, 2009; Deming and Stephan, 1940).

In the following section, we describe the methods involved in estimating each of these projection components, highlighting how this update leverages data from both the national statistical

DRAFT

system and the humanitarian data ecosystem of Sudan to reflect the impact of recent demographic change.

a. Baseline Population

Our projections use as a baseline the 2008 census of Sudan, with the age and sex-disaggregated ADM-1 census tabulations of the Central Bureau of Statistics forming a key reference. The baseline used reflects the following adjustments:

1. Reflecting the impact of ADM-1 boundary changes, using a retabulated census dataset developed by the United States Census Bureau as part of the 2021 Subnational Population and Housing Table (USCB 2021). ADM-1 sex and age distributions for ADM-1 areas formed after the 2008 census are derived from their previous ADM-1 division(s), in line with proportional changes in total population.
2. Accounting for potential under-enumeration, in line with United Nations Population Division standard approaches reflect under-enumeration of the general population and of children under the age of 10 (a group especially likely to be under-enumerated). The second adjustment is carried out using the BASEPOP approach (Arriaga et al., 1994), which was initially implemented by the United States Census Bureau and is now available through the DemoTools R package (Riffe et al., 2019). This method adjusts counts of children below age 10 using previous fertility and mortality estimates, along with female population counts.

b. Mortality

Projected ADM-1 mortality is based on data from the national statistical system, leveraging life expectancy at birth estimates from the 2008 and 1993 censuses, as reflected in a CBS 2008 census thematic report. Annual ADM-1 life expectancy at birth estimates are modeled using a Bayesian probabilistic approach, implemented through the BayesLife R package used by the United Nations Population Division.

These estimates are then converted into annual lifetables in line with the Coale-Demeny-Vaughan North model life tables (Coale et al. 1983), using the United Nations Population Division Mortcast R package (Ševčíková et al. 2022). The use of the Coale-Demeny-Vaughan North life table is aligned with the United Nations Population Division's approach to estimating mortality for Sudan for the World Population Prospects 2022 and 2024 revisions (UN DESA 2022, UNDESA 2024).

c. Fertility

Similarly, projected ADM-1 fertility is based on data from the national statistical system, leveraging total fertility rate (TFR) estimates from the 2008 and 1993 censuses, as reflected in a CBS 2008 census thematic report on fertility, alongside household survey-based TFR estimates from the UNICEF Multi-Indicator Cluster Survey (MICS) 2014 summary report (CBS and

DRAFT

UNICEF, 2016). These estimates are used to develop modeled annual ADM-1 TFR estimates, implemented through the BayesTFR R package used by the United Nations Population Division (Ševčíková et al. 2011). Age-specific fertility patterns are derived from the World Population Prospects 2022 revision (UN DESA 2022).

d. International (ADM-0) Migration and Mobility

Our projected international migration estimates reflect (a) mobility across international borders prior to April 2023, both in terms of crisis-related mobility and other mobility (b) crisis-related mobility after April 2023, since the start of the current crisis.

Our projections for (a) rely on the overall net migration flows estimated in the UN World Population Prospects 2024 revision, converted to estimated emigration and immigration flows using a method developed by Raymer et al. (2023). These are then disaggregated using UNHCR refugee flows data into crisis-related and other mobility, before further disaggregation to ADM-1 places of origin/location in Sudan and by age and sex:

1. ADM-1 distribution: Information on ADM-1 place of origin/location in Sudan is often difficult to obtain for different kinds of mobility, necessitating the use of a variety of data sources. This included:
    a. Multiple country-of-asylum-specific tabulations of ADM-1 places of origin for refugees and asylum seekers with Sudan as a country of origin (Nguyen et al., 2021; Jacobsen et al., 2021; UNHCR 2005). Given the very limited data available for this area, it was necessary to combine sources from different reference years and of varying technical approaches, using UNHCR refugee and asylum seeker flow data to weight country-of-asylum-specific estimates to derive overall ADM-1 estimates.
    b. UNHCR operational data on ADM-1 locations of refugees and asylum seekers with Sudan as a country of asylum (UNHCR 2024 and 2025).
    c. The IOM Sudanese Migrant Survey, used to estimate ADM-1 places of origin for non-crisis-related emigration prior to April 2023. (IOM 2023)
    d. The 2008 census IPUMS microdata sample, used as a reference for ADM-1 locations for other immigration to Sudan. These estimates used information from a census question on residence 1 year prior to the census reference date, filtered to individuals identified to have been outside of Sudan. (Ruggles et al. 2024)

2. Age and sex patterns: For mobility of refugees and asylum seekers, these are derived from UNHCR-UNICEF modeled age-sex distributions for 2022 and 2023 using a Bayesian model to impute missing observations (Beise et al., 2023)
   Age-sex profiles related to non-crisis-related mobility are derived using migration flow estimates by sex from Abel and Cohen (2022) and the Rogers-Castro model migration schedule “low dependency” variant (Rogers and Castro 1981), reflecting higher mobility in working ages in line with the prominence of international labor migration in the Sudanese context.

DRAFT

International mobility from April 2023 is estimated using UNHCR operational totals as of end-July 2024 on arrivals of refugees and asylum seekers with Sudan as a country of origin, as well as refugee returnees (refugees and asylum seekers with Sudan as a country of asylum, now returning to their countries of origin). Estimates of ADM-1 places of origin for international post-2023 out-mobility are based on an operational UNHCR-consolidated dataset reflecting a sub-sample of registrations in 5 Refugee Response Plan countries.

e. Internal (ADM-1 and ADM-2) Migration and Mobility

Our internal migration/mobility estimates similarly account for differences in mobility patterns prior to and after the start of the current crisis.

Pre-crisis estimates of internal, non-crisis-related mobility are based on data from the 2008 census IPUMS microdata sample, using information from a census question on ADM-1 place of residence 1 year prior to the census reference date. As with our international non-crisis-related mobility estimates, we use a Rogers Castro low dependency model migration age schedule to disaggregate these estimates.

Estimates of crisis-related mobility prior to and after the start of the current crisis are largely based on IOM DTM Mobility Update 19 (IOM 2025), which consolidates data on total numbers of IDPs across Sudan, including individuals displaced from 2003 onwards. Our approach also accounts for the mobility of self-relocated refugees and asylum seekers with Sudan as a country of asylum, as per data from UNHCR. While it is possible that the dataset's inclusion of IDPs displaced prior to the 2008 census could result in some bias in our internal mobility estimates, this population is relatively small in comparison to IDPs displaced since April 2023, who form the significant majority of internally displaced persons identified. Similarly, while it is possible that the mobility patterns reflected in the 2008 census could also reflect some degree of crisis-related mobility, this is expected to have a more limited impact on the final internal mobility estimates, which are heavily shaped by mobility since April 2023.

f. Disaggregation to ADM-2 by sex and age

As a starting point for our ADM-2 disaggregation, we use ADM-2 age and sex disaggregated projected estimates included in the CBS 2021-2025 post-censal projection for 2023. In disaggregating our ADM-1 projected totals to the ADM-2 level, we account for two key aspects:

1. ADM-2 boundary changes and their impact on relative population size. Given that significant administrative boundary changes have occurred since the 2008 census, we reflect as best as possible the impact of these changes on ADM-2 population size through incorporating all available data: CBS 2021-2025 ADM-2 projections, IPC 2020 and June 2023 population projections, and the USCB 2008 census retabulation.

DRAFT

Although these efforts make use of best available data on this area, there is limited information available on the impact of historical subnational administrative boundary changes on population size. This may result in greater uncertainty around our projected ADM-2 estimates, especially in ADM-1 areas that have seen significant ADM-2 boundary changes.

2. The impact of crisis-related internal mobility on ADM-2 relative size and age and sex structure. Our ADM-2 disaggregation using Iterative Proportional Fitting reflects both the impact of recent crisis-related mobility on relative ADM-2 size and age and sex structure, using IOM DTM Mobility Update 19 as a key reference. This adjustment to age and sex structure reflects the fact that some groups may be more likely to move than others, in the event of a crisis, and relies on IOM DTM data to understand the age and sex distribution of crisis-related mobility.

5. Cross-Validation

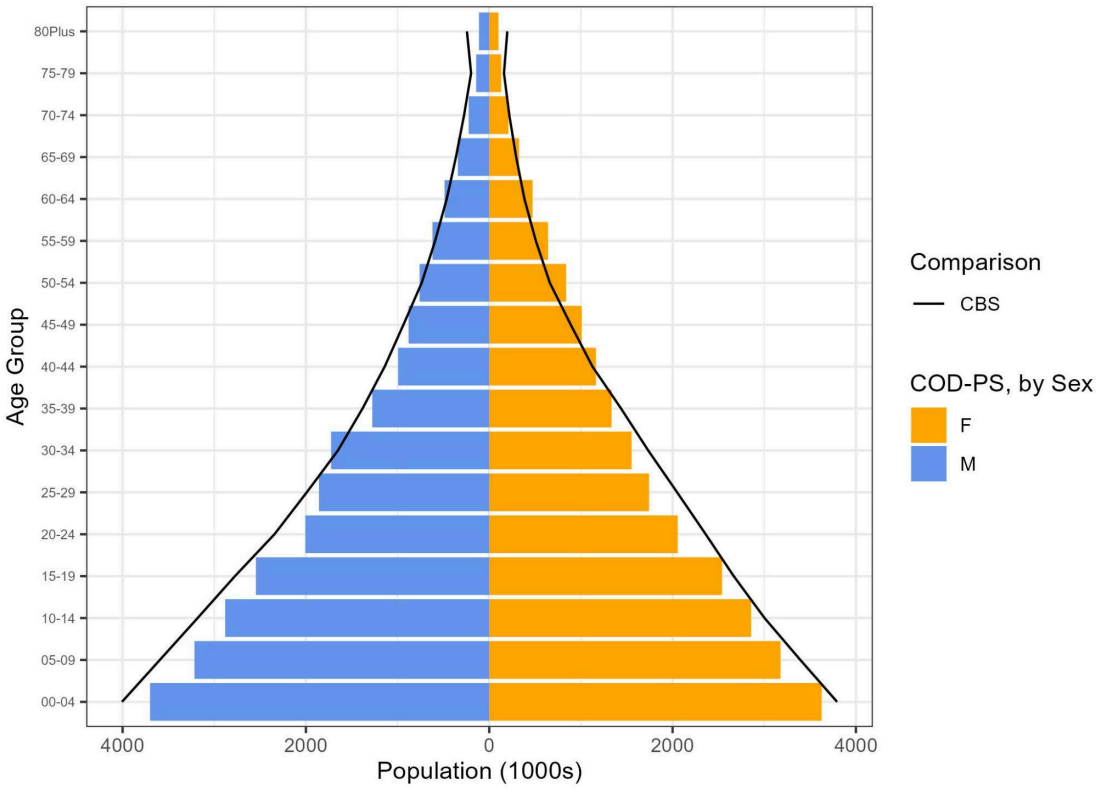

In order to better understand how the technical approaches, input data, and assumptions used in these projections may impact our estimates at the ADM-2, we cross-validate our estimates with other available population projection datasets from the Central Bureau of Statistics, IPC, and the UN Population Division. Cross-validation with other available population projections highlights significant alignment between our projections and other available data, with differences likely shaped by technical approaches and input data, and assumptions around mobility.

(a) Cross-validation with Central Bureau of Statistics 2021-2025 post-censal projections (ADM-0, ADM-1, ADM-2)

Figure 1. Comparison of 2024 COD-PS Update with CBS 2021-2025 post-censal projections

(i) ADM-0

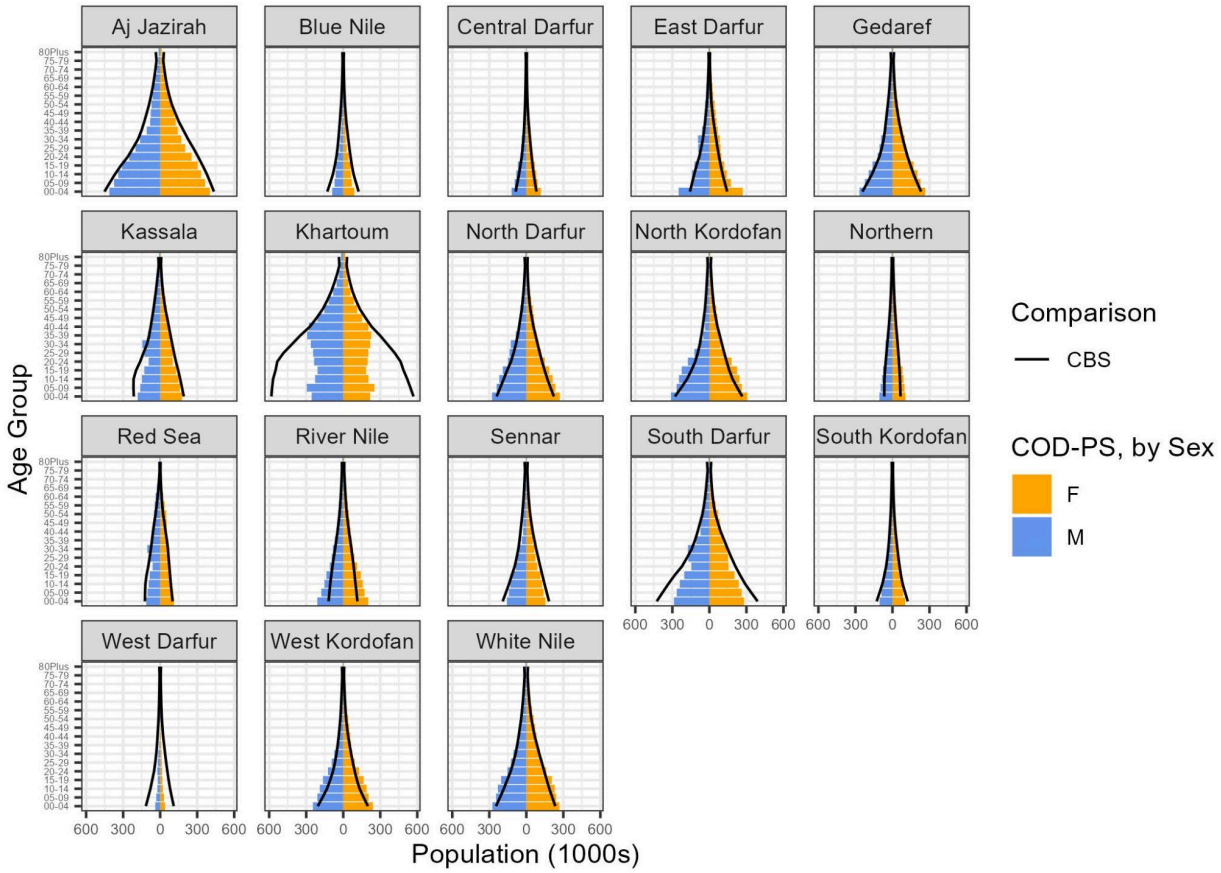

DRAFT

The 2025 COD-PS update is closely aligned with the age and sex distribution reflected in the CBS postcensal projections. The lower projected national total (around 47.55 million in the COD-PS, as compared to 50.75 million in the CBS projection for reference year 2025) reflects the impact of recent ADM-0 crisis-related mobility, which occurred after the CBS projections were constructed.

(ii) ADM-1

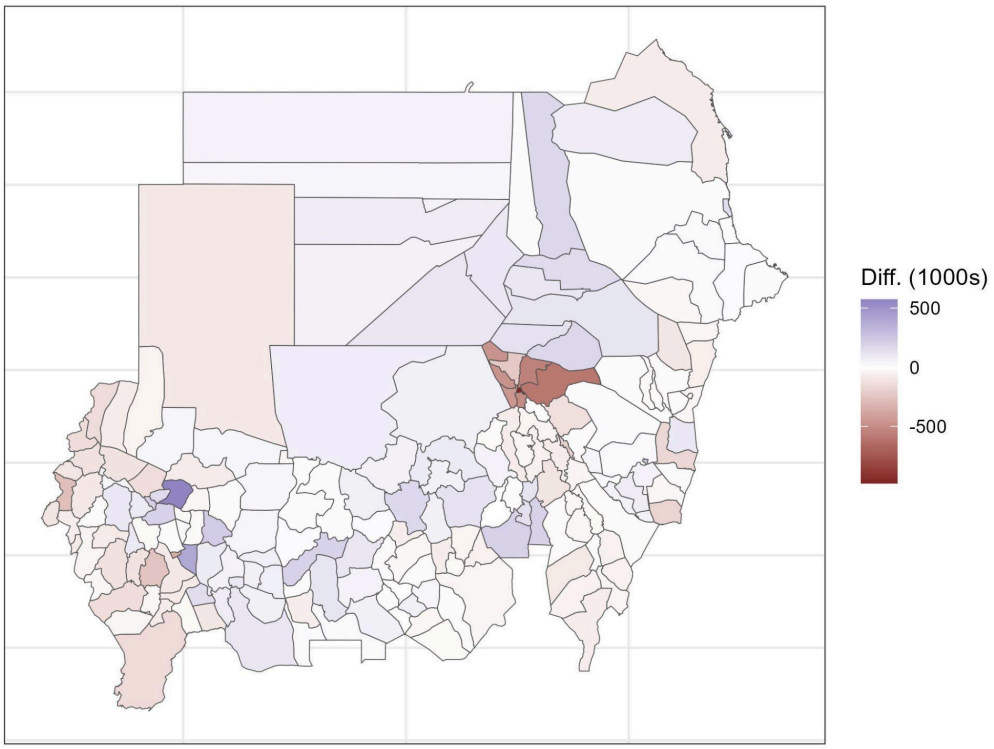

DRAFT

Similarly, the 2025 COD-PS is aligned with the CBS ADM-1 projection, with the most significant discrepancies noted in ADM-1 areas that saw high levels of crisis-related mobility associated with the current crisis, such as Khartoum and West Darfur.

(iii) ADM-2

DRAFT

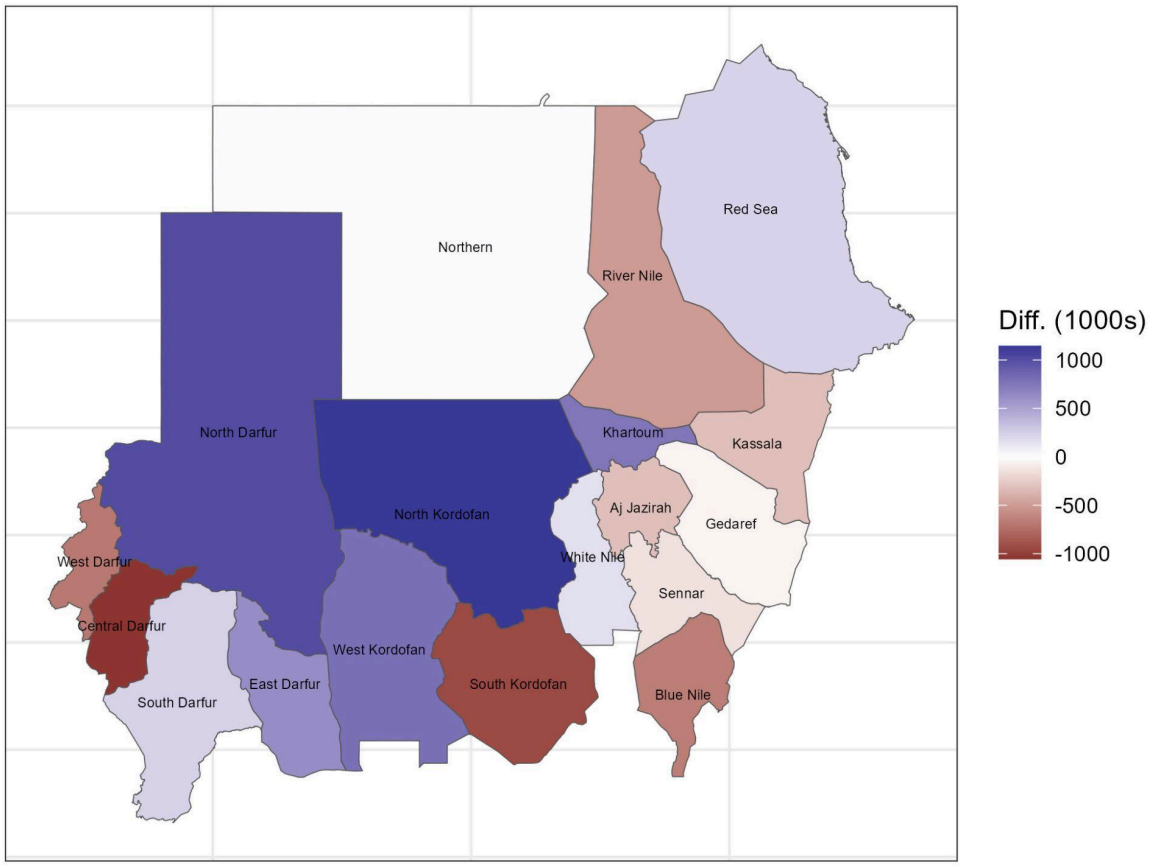

The impact of the differences in assumptions between the 2025 COD-PS and the CBS projections in terms of accounting for recent crisis-related mobility are reflected in this comparison at ADM-2. While some ADM-2 areas (shown in dark gray) are not directly compared due to administrative boundary changes, overall there is strong alignment between the two projections at ADM-2, with the greatest differences in localities that have seen high levels of recent crisis-related mobility, such as the localities in Khartoum state. Overall alignment reflects the use of CBS projections as a key input for ADM-2 disaggregation.

(b) Cross-validation with IPC population projections for April 2024 (ADM-0, ADM-1, ADM-2)

Figure 2. Comparison of 2024 COD-PS Update with IPC April 2024 projections

(i) ADM-0 and ADM-1

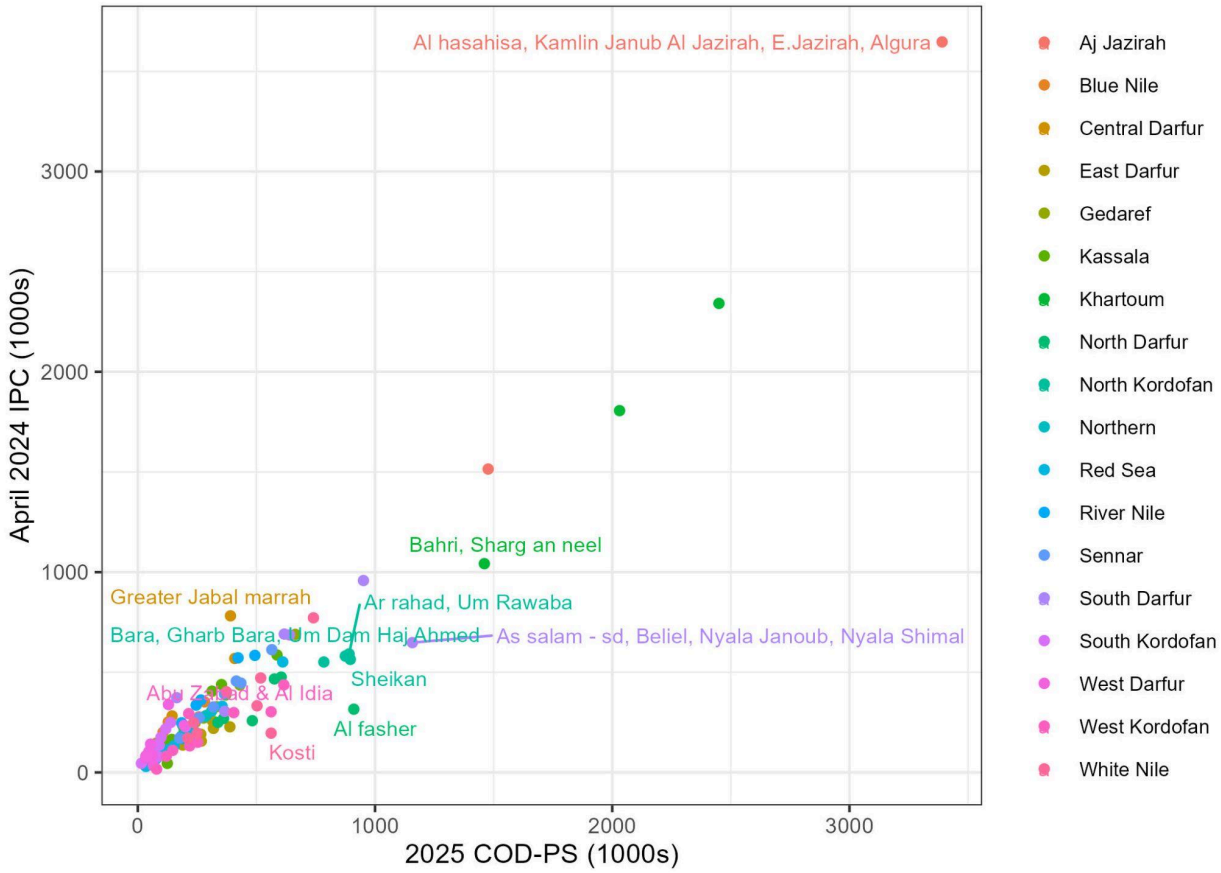

DRAFT

Comparison with April 2024 IPC population projections at ADM-0 show strong alignment with reference to the projected national total, with IPC projecting 47.2 million people in Sudan in comparison to the COD-PS projection of 47.55 million. Variation is observed at the ADM-1 level, however, with some states such as North and South Kordofan showing higher variation. This is likely a result of projection techniques and assumptions used, including in relation to the baseline population and the impact of recent crisis-related mobility.

(ii) ADM-2

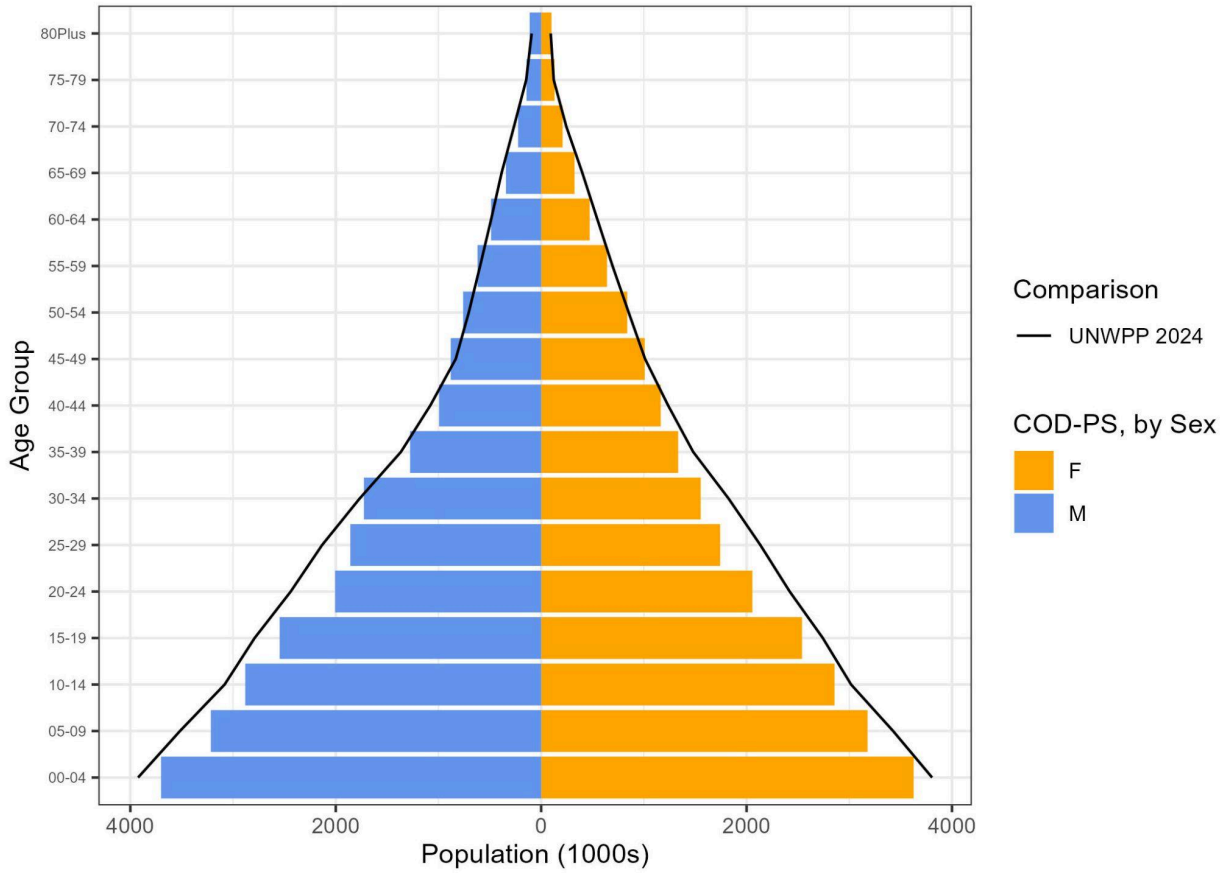

DRAFT

Comparison with IPC April 2024 projections at ADM-2 reflect generally high alignment with IPC projected totals, with variation likely shaped by differences in technical approach and input data, with the COD-PS additionally accounting for the impact of mobility since April (as reflected in UNHCR and IOM data). While exact comparison is not feasible due to differences in geographical and sub-population groupings used in the two projections, overall ADM-2 population size alignment reflects the use of previous IPC projections to inform our ADM-2 disaggregation.

(c) Cross-validation with United Nations World Population Prospects 2024 revision (ADM-0)

Figure 3. Comparison of 2025 COD-PS Update with UN World Population Prospects, 2024 revision

Comparison with the UN World Population Prospects 2024 similarly shows strong alignment at the national level in terms of the age and sex distribution, reflecting similarities in baseline population adjustment techniques and estimates of mortality and fertility. Differences in the projected national total (the WPP projects a total population of around 51.66 million, while the COD-PS projects a total population of 47.55 million) likely reflect differences in historical baseline population projections as well as estimates of international mobility.

6. Acknowledgements

UNFPA is grateful to the Central Bureau of Statistics (CBS), International Organization for Migration (IOM), United Nations High Commissioner for Refugees (UNHCR), Integrated Food Security Phase Classification (IPC), and OCHA for generously sharing source data and accompanying documentation used for the 2025 COD-PS update.

UNFPA expresses special gratitude:

- To IOM, for sharing locality-of-origin-level DTM Mobility Update 19 data, and for insightful consultations regarding data characteristics and availability.
- To UNHCR, for sharing operational refugee and asylum seeker data and modeled age

and sex profiles, and for insightful consultations about data characteristics and availability.
- To IPC, for insightful consultations regarding population projection techniques and data sources used in IPC estimation.
- To CBS, for valuable consultations related to the 2025 COD-PS update and humanitarian data needs in Sudan
- To the United Nations Population Division for guidance and support in modeling and adjusting for under-enumeration of children in the 2008 census of Sudan.
- To OCHA for coordinating the Information Management Working Group of the Humanitarian Country Team in Sudan and supporting the update of the core Common Operational Datasets for the 2025 Humanitarian Needs Overview and Humanitarian Response Plan rounds.

UNFPA technical work has benefited greatly from the technical discussions and collaborations with the Inter-Agency Working Group on interoperability of baseline population, displacement, and refugee data (IAWG-Interop). The institutional members of the IAWG-Interop include UNFPA, IOM, UNHCR, OCHA, UNPD, US Census Bureau, WorldPop at the University of Southampton, and the Leverhulme Centre for Demographic Science at the University of Oxford. The authors also kindly acknowledge general strategic guidance of Gulnara Kadyrkulova in the UNFPA Sudan Country Office.

8. Glossary of Technical Terms and Acronyms

The following glossary explains various technical terminology and acronyms that are used throughout this technical accompanying note.

ACLED	Armed Conflict Location and Event Data Project
ADM	Administrative areas of countries and territories.

DRAFT

	ADM-0 refers to national administrative boundaries, ADM-1, ADM-2, ADM-3 refers to subnational levels of administrative boundaries.
CBS	Central Bureau of Statistics, Sudan CBS is the official statistical agency of the Government of Sudan.
COD-AB	Common Operational Dataset on Administrative Boundaries (COD-AB) The COD-AB is a baseline geographical dataset containing location-specific P-codes (unique identifiers) and names down to the lowest geographic administrative level possible. The COD-AB is constructed using the 'best available' data to support operations and decision-making for all actors in a humanitarian response.
COD-PS	Common Operational Dataset on Population Statistics The Common Operational Dataset on Population Statistics (COD-PS) is a set of up-to-date (i.e. reference date within the last year) subnational population projections, disaggregated by sex and age (standard 5-year demographic age groups) to the lowest geographic administrative level possible. The COD-PS is constructed according to “best available humanitarian data” standards and designed to support short-term humanitarian decision-making.
IAWG-Interop	Inter-Agency Working Group on interoperability of baseline population, displacement, and refugee data. The core objectives of the IAWG-Interop are to advance the 1. Harmonization of COD-PS, COD-AB, IDP and refugee data through a series of deep dive data exercises, and 2. Development of draft methodological guidance on COD-PS, IDP and refugee data interoperability and data harmonization. The IAWG-interop consists of the following member institutions: United Nations Population Fund (Chair), International Organization for Migration (IOM), United Nations Refugee Agency (UNHCR), , the UN Office for the Coordination of Humanitarian Affairs (OCHA), United Nations Population Division (UNPD), Worldpop, University of Southampton, United States Census Bureau, and the Leverhulme Centre for Demographic Science.
IDP	Internally displaced persons
IOM	International Organization on Migration
IPC	Integrated Food Security Phase Classification (IPC) The IPC is a multi-partner initiative for improving food security and nutrition analysis and decision-making. At the global level, the IPC partnership includes 19 organizations and intergovernmental institutions: Action Against Hunger, CARE International, Comité Permanent Inter-États de Lutte Contre la Sécheresse au Sahel (CILSS), the Food and Agriculture Organization of the

	United Nations (FAO), the Famine Early Warning Systems Network (FEWS NET), the Global Food Security Cluster, the Global Nutrition Cluster, the International Food Policy Research Institute (IFPRI), the Intergovernmental Authority on Development (IGAD), the Joint Research Centre (JRC) of the European Commission, Oxford Committee for Famine Relief (Oxfam), the Southern African Development Community (SADC), Save the Children, the Sistema de la Integración Centroamericana (SICA), the United Nations Development Programme (UNDP), the United Nations Children's Fund (UNICEF), the World Bank, the World Food Programme (WFP) and the World Health Organization (WHO).
IPUMS	Integrated Public Use Microdata Series (IPUMS) IPUMS provides census and survey data from around the world integrated across time and space in support of the systematic analysis over temporal and spatial units, comparative research, and analysis at different levels (e.g. individual, household and community levels).
LE	Life expectancy
OCHA	Office for the Coordination of Humanitarian Affairs, United Nations
OHCHR	Office of the United Nations High Commissioner for Human Rights
UN	United Nations
UNHCR	United Nations High Commissioner for Refugees
UNPD	United Nations Population Division
UNFPA	United Nations Population Fund
USCB	United States Census Bureau The International Programs Center of the USCB conducts demographic, economic, and geographic studies of other countries and strengthens statistical development around the world through technical assistance, training, and software products.
WPP	World Population Prospects The WPP is the set of official United Nations population estimates and projections. They are revised biannually by the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat. The WPP presents population estimates from 1950 to the present for 237 countries or areas, underpinned by analyses of historical demographic trends. The 2024 revision also presents population projections to the year 2100 that reflect a range of plausible outcomes at the global, regional and national levels.
